

A large, complex industrial engine, likely a Fairbanks Morse model, is shown in a factory or workshop environment. The engine is a long, horizontal cylinder with multiple sections and various pipes and components. It is mounted on a base and surrounded by other industrial equipment and structures.

FAIRBANKS MORSE VISUAL INSPECTION

Reduce unplanned downtime and optimize your engine's performance with a Fairbanks Morse visual inspection performed by experienced, OEM factory-certified technicians.

A Fairbanks Morse visual inspection is a great, cost-effective way to ensure your engines are running efficiently when you need them most. A Fairbanks Morse Factory-Certified OEM technical representative will come onsite to visually inspect several critical points on the engine along with reviewing operating logs for any issues or critical incidents. This can all be done with the engine in operation or shut down for your convenience. The inspection only takes 4-6 hours per engine, so you can get the information you need immediately. Fairbanks Morse will partner with you to build a long-term plan if additional maintenance is required.

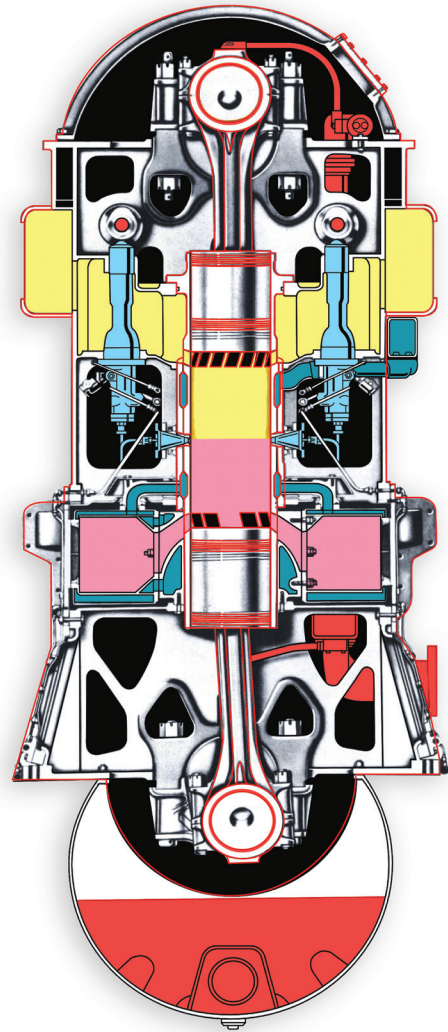

Fairbanks Morse Visual Inspection
